Office Action Summary

Application No.

10/028,009

Applicant(s)

DOUCETTE ET AL.

Examiner

Emmanuel Bayard

Art Unit

2631

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.138(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
 - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
 - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
 - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 21 December 2001.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-28 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-28 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claims 1-2, 4-15, 20-26 rejected under 35 U.S.C. 102(e) as being anticipated by Hata U.S. patent No 6,201,451 B1.

As per claims 1, 7, 20, 23 Hata teaches An apparatus, comprising: first section which outputs first and second digital signals, said first digital signal representing a predetermined waveform with a first phase shift imparted thereto in relation to reference, said second digital signal representing substantially said predetermined waveform with second phase shift imparted thereto relation to said reference, said second phase shift being different from said first phase shift (see abstract and fig.1 element 2 and col.3, lines 10-15 and col.7, lines 39-67 and col.12, lines 38-44); digital-to-analog converter section which converts said first and second digital signals respectively into first and second analog signals (see fig.1 elements 3I, 3Q and col.3, lines 17-21 and col.4, lines 27-40 and col.10, lines 45-67 and col.11, lines 63-67); phase shift section which produces a first adjusted signal by imparting to said first analog signal a phase shift which is

Art Unit: 2631

substantially equal and opposite said first phase shift, and which produces second adjusted signal by imparting to said second analog signal a phase shift which substantially equal and opposite to said second phase shift (see fig.1 section having elements 6I, 7, 8, 6Q and col.3, lines 25-30 and col.4, lines 43-55 and col.6, lines 1-5); and second section operable to facilitate combining (see fig.1 element 9 and abstract and col.4, lines 158-67 and col.4, lines 30-32 and col.12, lines 56-67 and col.13, lines 5-6, 17-22)) of said first and second adjusted signals.

As per claims 2, 8, Hata teaches wherein said second section includes transmitter (see col.7, lines 2, 29) section which transmits first and second electromagnetic signals that respectively include said first and second adjusted signals.

As per claim 3 Hata inherently teaches wherein said transmitter section includes first and second antenna elements which are physically spaced from each other, said first and second electromagnetic signals being respectively transmitted through said first and second antenna elements.

As per claims 4, 9 Hata teaches including filter section (see fig.1 element 5I and 5Q) which effects band-pass filtering said first analog signal before said first analog signal is supplied to said phase shift section, and which effects band-pass filtering said second analog signal before said second analog signal is supplied to said phase shift section

As per claims 5, 21 Hata inherently teaches, wherein said first and second digital signals each have a plurality of successive states, each of said states being selected one first second predetermined states which are different.

As per claims 6, 12, 22 Hata teaches wherein said first and second digital signals each have a plurality of successive states; wherein said digital-to-analog converter section generates for each said state of said first digital signal a respective corresponding pulse (see fig.1 element 4) of said first analog signal which has a duration less than the duration of the corresponding state, said digital-to-analog converter section outputting a predetermined voltage between successive said pulses of said first analog signal; and wherein said digital-to-analog converter section generates for each said state of said second digital signal a respective corresponding pulse of said second analog signal which has a duration less than the duration of the corresponding state, said digital-to-analog converter section outputting a predetermined voltage between successive said pulses of said second analog signal (see col.9, lines 25-42, 55-65).

As per claim 10, Hata inherently teaches, wherein said predetermined voltage is approximately zero volt.

As per claim 11, Hata inherently teaches, wherein each said pulse has a duration, which is approximately half the duration of the corresponding state of said digital signal.

As per claim 13, Hata inherently teaches wherein said digital-to-analog converter generates positive pulse having predetermined magnitude when the corresponding state of said digital signal is said first predetermined state, and

Art Unit: 2631

generates negative pulse having said predetermined magnitude when the corresponding state of said digital signal is said second predetermined state; wherein said predetermined voltage is approximately zero volts.

As per claim 14, Hata inherently teaches wherein each said pulse has duration, which approximately half the duration the corresponding states of said digital signal.

As per claim 15, Hata inherently teaches apparatus according each said pulse has approximately a square wave shape.

As per claim 24, Hata inherently teaches wherein said step generating pulses is carried out so that each said pulse has a duration which is approximately half the duration corresponding state said digital signal.

As per claim 25, Hata inherently teaches wherein said step of generating said digital signal is carried out so that each said state of said digital signal is a selected one of first and second predetermined states which are different.

As per claim 26, Hata inherently teaches, wherein said step of generating pulses includes the steps of generating positive pulse having a predetermined magnitude when the corresponding state of said digital signal is said first predetermined state, and generating a negative pulse having said predetermined magnitude when the corresponding state of said digital signal is said second predetermined state.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

4. Claims 16-19 and 27-28 are rejected under 35 U.S.C. 102(e) as being anticipate by Mann et al Pub No 2004/016813 A1.

As per claims 16 and 27, Mann et al teaches apparatus, comprising: a Local oscillator is the same as the claimed (first section) which outputs first and second analog signals, said first analog signal representing predetermined waveform and said second analog signal representing substantially said predetermined waveform (see figs. 2 and 11 element LO and page 2, paragraph [0028]); a quadrature demodulator is the same as the claimed (first phase shift section) (see figs. 2 and 11 element 202 and page 2, paragraph [0028]) which produces first shifted signal by imparting to said first analog signal first phase shift, and which produces second shifted signal by imparting to said second analog signal second phase shift different from said first phase shift; an analog-to-digital converter section (see figs. 2 and 11 element 231 and page 2, paragraph [0029] which converts said first and second shifted signals respectively into first and second digital signals; further phase shift section (see

Art Unit: 2631

figs. 2 and 11 element 208 and page 2, paragraph [0029]) which produces a first adjusted signal by imparting to said first digital signal phase shift which is substantially equal and opposite said first phase shift, and which produces second adjusted signal by imparting to said second digital signal phase shift which substantially equal and opposite to said second phase shift; and a second section operable to facilitate combining (see figs. 2 and 11 elements 206 or 207 and page 2, paragraph [0029]) of said first and second adjusted signals.

As per claim 17, Mann et al teaches a wherein said first section includes a receiver section (see page 1, paragraph [009] and figs. 2 and 11). Furthermore implementing such receiver to have spaced antenna elements, and which receives substantially the same electromagnetic signal through each of said antenna elements, said first second analog signals each being derived from respective one of said antenna elements is inherently taught by Mann et al.

As per claim 18, Mann et al teaches including filter section (see fig.2 element 203). Furthermore implementing such filter to effect band pass filtering of said first shifted signal before said first shifted signal is supplied to said analog-to-digital converter section, and which effects band pass filtering of said second shifted signal before said second shifted signal is supplied to said analog-to-digital converter section is inherently taught by Mann et al.

As per claims 19, and 28 Mann et al teaches, wherein said first and second digital signals each have plurality successive states, each of said states being selected one of first and second predetermined states which are different (see fig.2 element 202).

Art Unit: 2631

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Patire U.S. Patent No 6,430,232 B1 teaches a phase constellation.

Linder et al U.S. Patent No 6,693,980 B1 teaches a wideband fast-hopping receiver.

Lee et al U.S. Patent No 6,549,56 B1 teaches a bandwidth reduced multi carrier.

Vannatta et al U.S. patent No 5,930,299 teaches a digital modulator.

Duperrary Pub No 20030095608 A1 teaches a transmitter with transmitter chain.

Hamada et al U.S Patent No 6,198,731 B1 teaches a radio communication apparatus.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Emmanuel Bayard whose telephone number is 571 272 3016. The examiner can normally be reached on Monday-Friday (7:Am-4:30PM) Alternate Friday off.

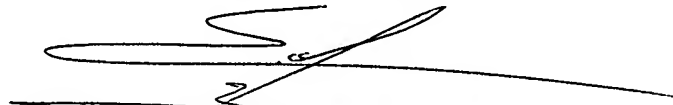

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mohammed Ghayour can be reached on 571 272 3021. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
